

# On the Reading Order of This Very Document

## Abstract

[A1] This paper is a test fixture. [A2] If you are reading the abstract first and the title before it, your pipeline has handled the spanning header correctly. [A3] Everything below is arranged in two columns, and the correct order is the entire left column, top to bottom, followed by the entire right column.

[S01] This is the first paragraph, and it sits at the top of the left column. [S02] A pipeline that reads horizontally across both columns will splice this sentence together with one from the right-hand side and produce nonsense.

[S03] This is the second paragraph, still in the left column. [S04] The word "third" should never appear before the word "second" in your output, and the marker S03 should always precede S04.

[S05] This is the third paragraph, and it ends the left column, so its final sentence deliberately runs past the bottom of the column and continues at the top of the

right column, where a correct pipeline must rejoin it with the words that follow.

[S06] Those words are these: you are now in the right column, and S05 should have ended just before this sentence began. [S07] If S06 appears before S05 in your output, you read the right column first.

[S08] This is the fifth paragraph. [S09] A hyphenated line break, such as "reconstruction", should come out as one word.

[S10] This is the final paragraph, and it is the last thing in the document. [S11] If this sentence is the last one in your output, the test passes.
